DETAILED ACTION

Election/Restrictions

1. Applicant's election without traverse of claims 1, 2, 7, 9, 11, 13 and 15 in the reply filed on 08/11/2006 is acknowledged.

Priority

2. Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

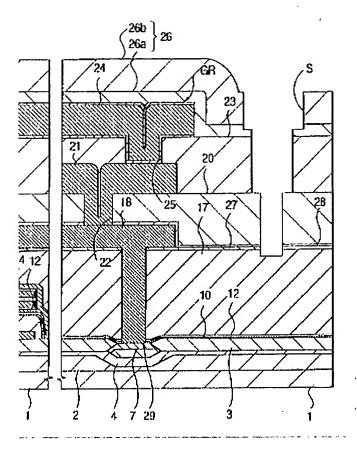

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims1, 2, 7, 9, 11, 13 and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Suwanai et al. (US 5,994,762) in view of Wolf further in view of Kishida (US 6,770,977).
- Regarding claims 1, 2, 13 and 15, Suwanai (e.g. fig. 11) shows a semiconductor device comprising: a semiconductor substrate 1; a first insulating film 17/27 formed above the semiconductor substrate and having a relative dielectric constant; a conductor 18 (e.g. aluminum/tungsten, col. 2/lls. 5-11) which covers a side face of the first insulating film at least near four corners of the semiconductor substrate (note that 18 is part of a guard ring GR, see fig. 3), and a second insulating film 20 covering the

outer side face of the conductor and having a relative dielectric constant of over 3.8 (inherent property of BPSG).

Suwanai does not teach that the first insulating layer has a relative dielectric constant of less than 3.8 nor a barrier layer on the at least an outer side face. Nevertheless, Wolf teaches that integrated circuits include a plurality of devices interconnected by multilevel interconnections including dielectric layers (pg 716-727). Also, the interconnect delay can be reduced by using low k dielectric material (e.g. nanoporous silica (SiO₂) "ultra low") having a dielectric constant of less than 2.0 (pgs.

semiconductor substrate.

791-795). Kishida (e.g. fig. 8b) teaches a barrier layer 202/203 composed tantalum nitride/tantalum is formed on an outer surface a conductor layer to prevent the metal atoms of the conductive layer from diffusing to the semiconductor substrate (col. 2/lls. 50-59 7 col. 8/lls. 26-28). It would have been obvious to one of ordinary skill in the art at the time the invention was made to use a low k dielectric material (e.g. nanoporous silica SiO₂) having a dielectric constant of less than 2.0 for the first dielectric layer disclosed by Suwanai in order to reduce the interconnect delay as taught by Wolf and to include a barrier layer on an outer surface a conductor layer disclosed by Suwanai in view of Wolf to prevent the metal atoms of the conductive layer from diffusing into the

- 6. Regarding claim 7, Suwanai shows that the second insulating film also covers an upper side of the first insulating film and a conductor 21 passing through the second insulating film positioned on the upper side of the first insulating film.
- 7. Regarding claim 9, Suwanai shows a conductive pattern buried in the first insulating film (e.g. 11, 15).
- 8. Regarding claim 11, Suwanai shows that the first insulating film is constituted of a plurality of layers 17/27.

Response to Arguments

9. Applicant's arguments filed 11/28/2006 have been fully considered but they are not persuasive.

Art Unit: 2826

- 10. In response to applicant's arguments against the references individually, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986).
- 11. In response to applicant's argument that there is no suggestion to combine the references, the examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988)and *In re Jones*, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, Wolf teaches that the interconnect delay can be reduced by using low k dielectric material (e.g. nanoporous silica (SiO₂) "ultra low") having a dielectric constant of less than 2.0 (pgs. 791-795) whereas Kishida teaches that a barrier layer composed tantalum nitride/tantalum is formed on an outer surface a conductor layer to prevent the metal atoms of the conductive layer from diffusing to the semiconductor substrate (col. 2/Ils. 50-59 7 col. 8/Ils. 26-28).
- 12. Applicant argues that the wiring 18 does not cover the side face of the film 17 or film 27. However, this limitation is disclosed by Suwanai because wiring 18 is part of a guard ring GR as shown in figure see fig. 3. Therefore, the layer 18 covers the side surface of film 17/27.
